**Cyclic nucleotide phosphodiesterase inhibitors,  
preparation and uses**

The invention concerns the use of PDE2 inhibitors for treating disorders of the central and peripheral nervous system, a method for therapeutic treatment by administering to an animal said inhibitors. More specifically, the invention concerns novel benzodiazepine derivatives and their uses in therapeutics more particularly for treating pathologies involving activity of a cyclic nucleotide phosphodiesterase. The invention also concerns methods for preparing same and novel synthesis intermediates.

The compounds whose synthesis is described in the present invention are novel and possess very interesting pharmacological properties : they are inhibitors of cyclic nucleotide phosphodiesterases and more particularly of cGS-PDE (cGMP-Stimulated PDEs or phosphodiesterase type 2 (PDE2) and, as such, they have very interesting therapeutic applications.

The functions of most tissues are modulated by endogenous substances such as hormones, transmitters, etc. or by exogenous substances. The biological effect of some of these substances is transmitted inside the cell by enzymatic effectors, such as adenylate cyclase or guanylate cyclase. Stimulation of said enzymes results in an elevation of intracellular levels of cyclic AMP (cAMP) or cyclic GMP (cGMP), second messengers involved in regulating many cellular activities. These cyclic nucleotides are degraded by a family of enzymes – the phosphodiesterases (PDE) – comprising at least seven groups.

One of them, PDE2, hydrolyzes both cAMP and cGMP and can be activated by cGMP. In physiological conditions PDE2 responds to high cGMP concentrations by increasing the hydrolysis of cAMP. This group is called PDE2 and is present in many tissues (adipocytes, adrenals, brain, heart, liver, lung, blood vessels, etc.). PDE2 inhibitors are capable of increasing or maintaining intracellular levels of both cAMP and cGMP and as such, find uses in the treatment of various pathologies.

The applicant has now demonstrated that certain benzodiazepines have inhibitory effects on cyclic nucleotide phosphodiesterases, particularly inhibition of PDE2. The invention also describes novel compounds exhibiting potent inhibitory activity towards

PDE2, and preferentially displaying an excellent selectivity profile relative to other PDE isoforms, in particular a weak action on PDE3. Said selectivity can also extend to other enzymes, such as adenosine deaminase. Thus, the invention also describes novel compounds having potent inhibitory activity towards PDE2, and preferentially displaying an excellent selectivity profile on PDE2 in comparison with adenosine deaminase. Moreover, preferred compounds according to the invention have important central effects (anticonvulsant, anxiolytic, sedative, antidepressant) or peripheral effects (antirheumatismal, against auto-inflammatory diseases, against age-related liver dysfunction), and advantageously are devoid of memory impairing effects.

The invention therefore has as a first object the use of at least one phosphodiesterase 2 inhibitor for preparing a pharmaceutical composition for treating pathologies of the nervous system (central and peripheral), particularly central.

More specifically, the pathologies are those due to a deregulation of the function of a neurotransmitter or a deficiency in the release of a neurotransmitter (eg., dopamine, norepinephrine, acetylcholine, etc.), in particular dopamine, such as more specifically a pathology selected in the group consisting of depression, schizophrenia, anxiety, bipolar disorder, attention deficit disorders, sleep disorders, OCD - obsessive compulsive disorder, fibromyalgia, Tourette's syndrome, pharmacodependence (to drugs, medication, alcohol, etc.), epilepsy, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, multiple sclerosis, obesity and Lewy body dementia.

PDE2 inhibitors can also be used according to the invention for treating other disorders involving the peripheral nervous system and peripheral organs in general, in particular pathologies of the type reduced natriuria, acute renal failure, hepatic dysfunction, acute hepatic failure, in particular due to age, and pathologies due to or involving dysfunctions of prolactin secretion, such as restless legs syndrome, rheumatismal, allergic or auto-inflammatory disorders, such as rheumatoid arthritis, rhinitis and asthma.

A particular object of the invention is therefore based on the use of PDE2 inhibitors for preparing a medicament for treating central or peripheral nervous system disorders, chronic or acute, or peripheral use of said inhibitors as vasoconstrictors.

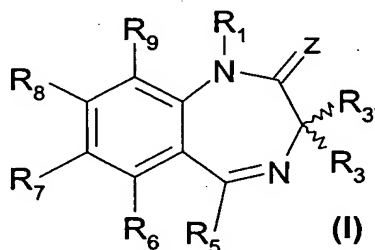

According to a particular object of the invention, the PDE2 inhibitors are used to treat anxiety, depression or schizophrenia.

Inhibitors of the activity or the expression of type PDE2 phosphodiesterase which are particularly useful according to the invention are compounds which have selective PDE2 inhibitory activity, that is to say, they have less inhibitory activity towards other phosphodiesterases and particularly PDE1, PDE3, PDE4 and PDE5.

5 Some of the PDE2 inhibitors are selected in particular in the scope of the invention for their selective inhibition of PDE2 relative to adenosine déaminase, meaning that they have more potent inhibitory activity for PDE2 than for adenosine deaminase.

Preferably, the PDE2 inhibitors used in the invention can be selected in the group consisting of 1,4-benzodiazepine derivatives.

10 In this context, the invention also describes novel compounds having potent PDE2 inhibitory activity. More particularly, the invention thus has as object compounds represented by general formula (I)

The invention further concerns the use of compounds represented by general formula (I) such as defined hereinabove for preparing a pharmaceutical composition intended for the inhibition of a cyclic nucleotide phosphodiesterase, in particular phosphodiesterase 2 (PDE2). More particularly, the invention concerns the use of the above compounds for treating pathologies involving a deregulation of intracellular levels of cyclic AMP and/or cyclic GMP.

In the spirit of the invention, the term "alkyl" designates a linear or branched hydrocarbon group advantageously containing from 1 to 12 carbon atoms, such as methyl, ethyl, propyl, isopropyl, butyl, isobutyl, *tert*-butyl, pentyl, neopentyl, n-hexyl, n-decyl, n-dodecyl, etc. C<sub>1</sub>-C<sub>6</sub> groups are preferred. The alkyl groups may be substituted by an aryl group such as defined hereinbelow, in which case it is called an arylalkyl (or aralkyl) group. Benzyl and phenethyl are specific examples of arylalkyl groups.

The term "cycloalkyl" denotes a cyclic hydrocarbon system, which may advantageously contain from 3 to 6 carbon atoms and be mono- or poly-cyclic. Examples include cyclopropyl and cyclohexyl groups in particular.

"Aryl" groups are mono-, bi- or tri-cyclic aromatic hydrocarbon systems, preferably monocyclic or bicyclic aromatic hydrocarbon systems containing from 6 to 18 carbon atoms, even more preferably 6 carbon atoms. Examples include phenyl, naphthyl and biphenyl groups.

"Heterocycle" groups denote hydrocarbon systems, aromatic or not, containing one or more cyclic heteroatoms. Preferably they are cyclic hydrocarbon systems containing from 5 to 18 carbon atoms and one or more cyclic heteroatoms, particularly from 1 to 3 or to 4 cyclic heteroatoms chosen from among N, O and S. Preferred aromatic heterocyclic groups (heteroaryls) include in particular thienyl, benzothienyl, benzofuryl, pyridyl, pyrimidinyl, pyridazinyl, isoquinolyl, quinolyl, thiazolyl, furyl, pyranyl, pyrrolyl, 2*H*-pyrrolyl, imidazolyl, benzimidazolyl, pyrazolyl, isothiazolyl, isoxazolyl and indolyl groups. Preferred nonaromatic heterocyclic groups include in particular the morpholino, piperidiny, piperazinyl and pyrrolidinyl groups.

The aryl and heterocycle groups may optionally be substituted by an alkyl, alkenyl or alkynyl group. An aryl or a heterocycle substituted by an alkyl group is called an alkylaryl or alkylheterocycle group. Examples of alkylaryl groups include in particular tolyl, mesyethyl and xylyl. An aryl or a heterocycle substituted by an alkenyl group is referred to as an alkenylaryl or alkenylheterocycle group. Examples of alkenylaryl groups include in particular the cinnamyl group. An aryl or a heterocycle substituted by an alkynyl group is called an alkynylaryl or alkynylheterocycle group.

The aryl and heterocycle groups may also be substituted by a group independently selected from aryl or heterocycle groups, themselves optionally substituted by one or more substituents preferably selected in the group consisting of a

halogen atom and a NO<sub>2</sub>, CN, CF<sub>3</sub>, OR', COR', COOR', alkoxy, NHCOR' or CONR'R'' group, R' and R'' being such as defined hereinabove.

Specific examples of aryl and heterocycle groups substituted by an aryl or heterocycle group are the benzothienyl, benzofuryl, furylphenyl, benzyloxynaphthyl, pyridylphenyl, phenylphenyl and thienylphenyl groups. As noted, the hereinabove groups may be substituted. In this respect one example is the phenyl groups substituted by a phenyl group itself substituted by a halogen atom, a NO<sub>2</sub>, CF<sub>3</sub>, methoxy or methyl group.

"Alkenyl" groups are linear or branched hydrocarbon functions containing one or more double bonds. Advantageously they contain from 2 to 6 carbon atoms and, preferably, 1 or 2 double bonds. Alkenyl groups may be substituted by an aryl group such as defined hereinabove, in which case it is called an arylalkenyl group.

Alkynyl groups may be substituted by an aryl group such as defined hereinabove, in which case it is called an arylalkynyl group.

"Alkoxy" groups correspond to the alkyl and cycloalkyl groups defined hereinabove linked to the nucleus by an -O- (ether) bond. Methoxy and ethoxy groups are especially preferred.

 25 subcutaneous, oral and inhalation routes being preferred. For injections, the compounds are generally prepared in the form of liquid suspensions, which can be injected through syringes or by infusion, for instance. In this respect, the compounds are generally dissolved in pharmaceutically compatible saline, physiologic, isotonic, buffered solutions and the like, known to those skilled in the art. For instance, the compositions

5        - Construction of the benzodiazepinone ring, 3 and derivatives 10-11-12

Route 1 carried out by heating the compound of general formula 2 under reflux in the presence of  $\alpha$ -aminoacid ester hydrochloride and pyridine at a temperature comprised between 100°C and 150°C leads to formation of a compound having general formula 3. Route 2 carried out by addition of an acetyl halogenide of the type  
10        bromoacetyl bromide, followed by ring formation in the presence of ammonia gas in a hydroxylated solvent of the type methanol, leads to the compound having general formula 3 in which  $R_{10}$  is such as defined hereinabove.

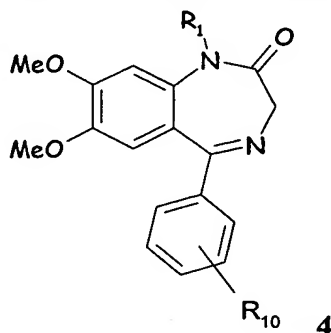

15        Reaction of a compound of type 3 with the Lawesson reagent in toluene under reflux, can convert a compound represented by formula (I) in which Z is an oxygen atom to a compound represented by formula (I) in which Z is a sulfur atom and thus form a compound of type 10.

20        Transformation a compound represented by formula (I) in which Z is a sulfur atom to a compound represented by formula (I) in which Z represents  $NR_{13}$  can be carried out in particular by reacting the sulfated compound 10 obtained in the previous step, in the presence of an amine of formula  $NH_2R_{13}$  or by a compound of formula

$(\text{NH}_2)(\text{R}_{11})(\text{CH}_2)_2(\text{OEt})_2$ ,  $\text{R}_{11}$  and  $\text{R}_{13}$  representing a substituent group such as defined hereinabove.

- Other substitutions and transformations of benzodiazepinones 3

- 5      Reaction in the presence of an alkyl halogenide, preferably in a solvent of the type DMF in the presence of NaH, leads to formation of an N-alkylated compound of general formula 4 in which  $\text{R}_1$  and  $\text{R}_{10}$  are such as defined hereinabove.

- 10      Optionally, transformation of a compound having formula 4 ( $\text{R}_{10} = 3\text{-CN}$ ) to compound 5 is accomplished by oxidation of the aromatic nitrile function, by reaction with  $\text{H}_2\text{O}_2$  and NaOH at  $50^\circ\text{C}$  in ethanol.

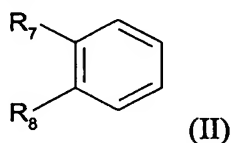

- 15      Optionally, transformation of a compound having formula 4 ( $\text{R}_{10} = 3\text{-Br}$ ) to compound 6 is accomplished by palladium coupling in the presence of an aryl boronic acid, or a monosubstituted or monofunctionalized alkyne and a base  $\text{K}_3\text{PO}_4$ ,  $\text{K}_2\text{CO}_3$ , triethylamine according to the reaction partners. The Pd(0) or Pd(II) complex is of the type  $\text{Pd}(\text{PPh}_3)_4$  or  $\text{PdCl}_2$ , in a solvent of the type DMF, EtOH.

- 20      Optionally, transformation of a compound having formula 4 ( $\text{R}_{10} = 3\text{-CN}$ ) to compound 8 is accomplished by reduction of the nitrile function by hydrogenation in methanol in the presence of Raney nickel.

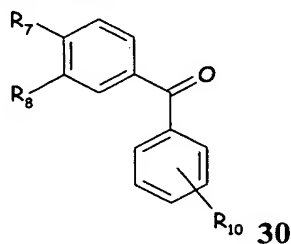

- 25      Optionally, transformation of a compound having formula 4 to compound 7 is accomplished by alkylation on carbon 3 by reaction of a base, preferably BuLi, in a solvent of the type THF, and addition of an electrophile of the type alkyl, cycloalkyl, benzyl bromide or chloride, substituted or not.

According to a second method illustrated in Figure 2, compounds represented by general formula (I) can be prepared by a method comprising the following steps :

- 5      Reaction of a compound represented by general formula (II)

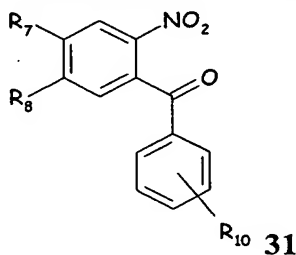

- in which R<sub>7</sub> and R<sub>8</sub> are such as defined hereinabove, with an acylating agent, such as a compound of the type benzoyl chloride substituted at least in position 3, in the presence of a Lewis acid, in particular in the presence of SnCl<sub>4</sub>, in a halogenated solvent of the type CH<sub>2</sub>Cl<sub>2</sub> leads to formation of a benzophenone of formula 30
- 10

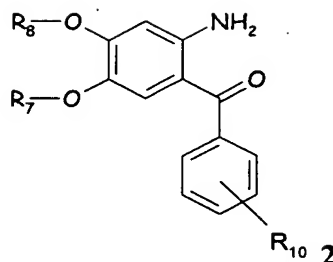

in which R<sub>7</sub> and R<sub>8</sub> are such as defined hereinabove and R<sub>10</sub> is a substituent group on the phenyl.

- 15      Reaction of the compound of formula 30 in the presence of CH<sub>3</sub>COOH and HNO<sub>3</sub> at room temperature leads to formation of a nitrated compound of formula 31

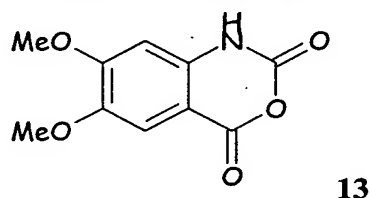

The hydrogenation reaction in the presence of a catalyst of the type Pd/C in methanol gives a compound of type 2

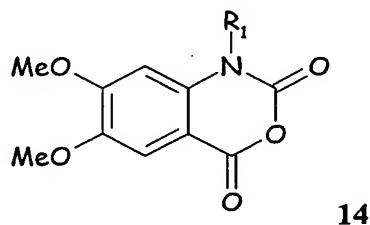

Carrying out **route 1** or **route 2** starting with a compound of type **2** leads to a compound of type **3**.

- 5 According to another embodiment (Figure 3), compounds represented by general formula (I) according to the invention in which Z is an oxygen atom can be prepared from a compound represented by general formula **13**.

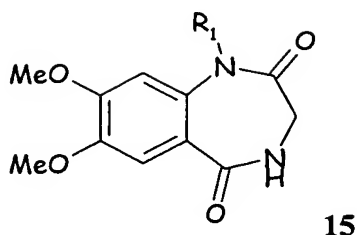

Reaction of a compound of general formula **13** :

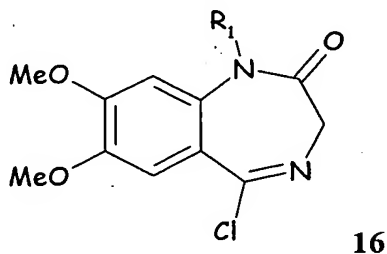

- 10 in the presence of an alkyl halogenide, preferably in a solvent of the type DMF in the presence of NaH, leads to an N-alkylated compound of general formula **14** in which R<sub>1</sub> is such as defined hereinabove

## 10 **EXAMPLE 2 : PHARMACOLOGICAL ACTIVITY : INHIBITION OF PHOSPHODIESTERASES.**

### 2.1. Isolation of phosphodiesterases from smooth muscle

15 A 3 g segment of bovine aortic media cut into pieces with scissors was homogenized with an ultra-turrax then a potter glass/glass homogenizer in 7 volumes by weight of buffer A containing a protease inhibitor cocktail (20 mM Tris-HCl, 0.25 M saccharose, 2 mM magnesium acetate, 1 mM dithiothreitol, 5 mM EGTA, 2000 U/ml aprotinin, 10 mg/l leupeptin and 10 mg/l soya trypsin inhibitor). The homogenizate was centrifuged at  
20 105,000 g for 1 hour. The supernatant was loaded on a DEAE-Sephacel column (15 x 1.6 cm) pre-equilibrated with buffer B (buffer A without the saccharose, EGTA and protease inhibitors). The column was washed until there was no detectable absorption at 280 nm, then eluted with a linear gradient of NaCl (0-0.5 M) in buffer B. 3-ml fractions were collected and enzyme activity was determined under the conditions described  
25 hereinbelow to localize the different enzymes PDE1, PDE3, PDE4 and PDE5 which were aliquoted and frozen at  $-80^{\circ}\text{C}$  (Lugnier et al., *Biochem. Pharmacol.*, 1986, 35: 1746-1751). PDE2 was prepared from bovine endothelial cells by the same methods (Lugnier and Schini, *Biochem. Pharmacol.*, 1990, 39: 75-84).

### 30 2.2. Protocol for measuring phosphodiesterase activity

Cyclic nucleotide phosphodiesterase activity was determined by a radioenzymatic method using tritium-labelled cyclic GMP or AMP (1  $\mu\text{M}$ ) as substrate (Lugnier et al.,

1986).  $^3\text{H}$ -labelled adenosine or guanosine monophosphate formed by hydrolysis of the radiolabelled cyclic nucleotide was then converted to  $^3\text{H}$ -labelled adenosine or guanosine in a second reaction with one nucleotidase in excess. The nucleoside formed was separated from the nucleotides by anion exchange chromatography. Nucleoside radioactivity was determined by liquid scintillation counting. Enzymatic incubations were carried out under conditions allowing no more than 15 % hydrolysis of the substrate; each point was performed in duplicate.

#### 2.2.1. Determination of inhibition of PDE2.

10

The concentration of substance which inhibits enzymatic activity by 50 % ( $\text{IC}_{50}$ ) at 1  $\mu\text{M}$  cyclic AMP was calculated by nonlinear regression from the experimental values of hydrolysis rate (Prism, GraphPad).

#### 2.2.2. Selectivity

15

The activity of the compounds was evaluated on other phosphodiesterase isoforms, particularly basal state or calmodulin-activated PDE1 from vascular smooth muscle, PDE3, PDE4 and PDE5 from vascular smooth muscle.

20

The results obtained are presented in Tables 1 and 2 hereinbelow and are expressed as the percentage inhibition of enzymatic activity produced by 10  $\mu\text{mol}$  of the test compound.

### EXAMPLE 3 : BEHAVIORAL TESTS

Compound 5a was evaluated in different behavioral tests

#### 3.1 Elevated plus maze test

This test was validated in the rat by Pellow in 1986 and in the mouse by Lister in 1987. It is based on an aversion to open spaces: the open arms elicit anxiety in the animals while the closed arms represent safety. By recording the frequency of entry into each arm, this test evaluates the anxiolytic effect of a molecule in comparison with a reference compound such as buspirone.

Ten to eleven-week old Balb/c or Swiss mice were used for the test. Mice were randomly divided into a control group (treated with the vehicle) and other groups treated with the test compounds.

The test apparatus was a PVC maze with a plexiglass lid, divided into four equivalent exploration arms (45 x 10 cm), all interconnected by a small platform (10 x 10 cm). The apparatus was placed 66 cm above the floor. Two arms were opened and the other two closed with a wall (height : 30 cm).

After administration, the mouse was placed on the platform opposite the closed arm. The number of entries and the time spent in each open arm were recorded over 8 minutes.

The treatment was administered 1 hour before the test. The compounds were given orally at different doses. The results are shown in Figures 8 and 9. N=10; \*\*\*  $p < 0.005$  and \*\*\*\*  $p < 0.001$  (versus control; Dunnett test).

A significant difference between the groups was observed, in particular with regard to the percentage of time spent in the open arms. Mice treated with compound 5a spent more time in the open arms, and this at all doses tested.

### 5    3.2 Swim test

This test is based on the induction of alternative behavior in rodents subjected to an acute stress. In this model, the rat or mouse placed in a water-filled cylinder adopts a particular state of immobility. Onset of said immobility is delayed by antidepressants administered acutely or in repeated doses.

10

Wistar rats or Swiss mice were used. Animals were isolated for one week with a reverse light/dark cycle, then placed in the water-filled cylinder for 6 minutes.

The total immobility time was recorded during the last 4 minutes.

15    The treatment was administered 20 minutes before the test. Four groups were used to test three different doses : one control group treated with the vehicle, and one group for the three doses.

The results are shown in Figures 10 and 11. Two parameters were recorded : onset of immobility and immobility time.  $N=10$  ; \*\*\*  $p<0.005$  (Dunnett test).

20

The statistical analyses showed a significant difference between the groups for total immobility time ( $p = 0.007$ ). Mice treated with compound 5a at 3 and 30 mg/kg had a shorter immobility time than the control group and the group treated with compound 5a at 0.3 mg/kg.

25

### 3.3 Light/dark test

30    This light/dark test is based on the natural tendency of rodents to prefer a dark environment and thereby evaluates the emotional responses of the animals in a situation of bright light. This procedure is suitable for assessing the state of anxiety elicited by anxiety stimuli (Lister's group, 1990). Mice placed in the apparatus, while showing a preference for the dark zone, nonetheless explore the light zone. This procedure was validated in 1990 by Misslin et al., who demonstrated that the anxiolytic and angiogenic

properties of different substances act on the serotonergic system or on benzodiazepine GABA receptor complexes.

5 Ten to eleven-week old Balb/c or Swiss mice were used. Mice were randomly divided into a control group (treated with the vehicle) and other groups treated with the test compounds.

10 The test apparatus consisted of two PVC compartments (20 x 20 x 14 cm) with a plexiglass lid. One of the compartments was dark. A 100W light bulb was placed 15 cm above the other compartment, emitting the only light in the room (approximately 4400 lux). An opaque plastic tunnel separated the light and dark compartments.

15 The animal was placed in the light compartment with its head pointed towards the tunnel. The time spent in the light compartment and the number of entries into the light compartment were recorded for 5 minutes after the first entry into the dark zone. The test compound or the control treatment were administered orally 1 hour before the test.

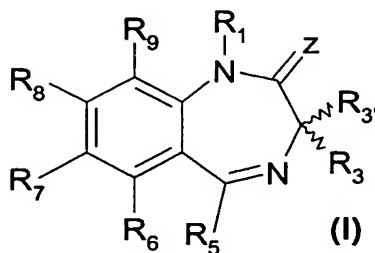

The results are shown in Figures 12 and 13. N = 10; \*\*  $p < 0.01$  ; \*\*\*\*  $p < 0.001$  (Dunnett test versus control).

20 A significant difference was observed between the groups for the time spent in the light compartment ( $p < 0.001$ ). Mice treated with compound 5a at 0.3, 3 and 30 mg/kg spent significantly more time in the light compartment as compared with controls ( $p < 0.01$ , control versus Dunnett test).

25 Together these results confirm the anxiolytic and antidepressant effect of the inventive compounds and in particular of compound 5a, in particular at the doses tested.

### **Cyclic nucleotide phosphodiesterase inhibitors, preparation and uses**

NEURO3D

#### **SUMMARY**

The invention concerns the use of PDE2 inhibitors for treating disorders of the central and peripheral nervous system, a method for therapeutic treatment by administering to an animal said inhibitors. More specifically, the invention concerns novel benzodiazepinone derivatives and their uses in therapeutics more particularly for treating pathologies involving activity of a cyclic nucleotide phosphodiesterase type 2. The invention also concerns methods for preparing same and novel synthesis intermediates.
